

Clinical Decision Support Report

Report ID: GDAI-AML-0001
Generated: 07 July 2026

Patient Information

Patient Name	Mariam Gamal
Patient ID	AML-0001
Age / Gender	45 Years / Female
Diagnosis	Acute Myeloid Leukemia (AML)
Treating Physician	Dr. Mariam Amgad
Report Type	Clinical Decision Support

QC Passed

NGS Ready

AML Case

NGS Analysis Summary

Reference Genome	GRCh38	Sequencing Status	Completed
Input Data	VCF / AML targeted panel	Analysis Status	Successfully processed

Detected Genomic Findings

Gene	Variant	Clinical Significance	Actionability
FLT3	FLT3-ITD	Pathogenic	FLT3 inhibitor candidate
NPM1	Mutation detected	Clinically relevant	Supports risk interpretation

ELN 2022 Risk Classification

INTERMEDIATE RISK

Risk assessment is based on FLT3-ITD detection with NPM1 mutation context.

Recommended Therapy

Midostaurin

Consider with standard induction chemotherapy under physician supervision.

AI Clinical Interpretation

GeneDose AI identified clinically significant AML genomic alterations. The detected FLT3-ITD mutation may benefit from targeted FLT3 inhibitor therapy combined with standard induction chemotherapy, while NPM1 mutation contributes to risk interpretation. The report is intended to support physician review and does not replace clinical judgment.

Evidence sources: ELN 2022 NCCN FDA

Clinical Decision Support Report

Report ID: GDAI-AML-0001
Generated: 07 July 2026

Monitoring Plan

- Complete blood count (CBC) monitoring
- Bone marrow assessment after induction
- Minimal residual disease (MRD) evaluation
- Follow-up genomic testing if clinically indicated

Treatment Recommendation Detail

Targeted agent	Midostaurin
Combination	Cytarabine + Daunorubicin
Purpose	FLT3-directed treatment support
Review status	Pending physician approval

Clinical Evidence & Knowledge Sources

ELN Guidelines Risk stratification and AML classification.	NCCN Guidelines Therapy pathway and clinical decision support.	FDA Labels Approved indications for targeted therapies.
